

Scalability & Future Plan

Metadata Field	Details
Date	30 September 2026
Team ID	SWTID-2026-6449
Project Name	LegalEase: AI-Powered Legal Document Generator
Maximum Marks	1 Mark

Current System Limitations

S.No	Limitation	Impact	Priority to Address
1	Context-window limits during single-turn processing of multi-page legal documents (>50 pages).	Can cause text processing failures if long files are uploaded at once.	Medium
2	Third-party AI generation cost structures under high request volume spikes.	Limits scalability for free-tier users during peak hours.	High
3	Static legal template sets restricting output options to select agreement formats (NDAs, Leases).	Restricts the platform's utility for complex, specialized legal needs.	Low

Scalability Plan

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Supports ~100 active connections before routing speeds begin to dip.	Migrate to AWS Elastic Container Services (ECS) with automated horizontal pod scaling.
2	Data Storage	Relies on local relational file storage rows for document tracking metadata.	Deploy distributed AWS S3 storage buckets with strict row level database encryption rules.
3	Performance	Complex clause translations take 4–5 seconds to render in the UI panel.	Set up asynchronous Celery worker clusters with Redis to process background text analytics.
4	Security	Simple user access management tied to baseline server verification hooks.	Implement OAuth2 enterprise frameworks and multi-factor hardware login tokens.
